

# Toward Landslide Forecasting from Images and Mechanics

Christoph Mertz (RI), Amit Acharya (CEE), Asish Madala (CEE), and Karen Lightman (Metro21)

# 2018: Record year of landslides in our region

- Record **rainfall**: wettest year
- Soil: **red clay**
- Many **hills**
- Not enough **\$\$\$**

Route 30

Greenleaf St. /  
West End

# Motivation

- Computer vision, machine learning, failure modeling in materials and structures have made great advances in recent years
- We have a large collection of road images
- How can these tools be used to predict and analyze landslides?

=> Collaboration between Robotics and CEE

# Classification

## Example: Road Crack Detection

using computer vision and machine learning

Road segmentation

Detection of cracks

Possible indicators for impending problems:  
Debris on road, change of color of soil, pooling of water, ...

# Indicator events in images

Debris on road

Cracks: longitudinal,  
then curving

Persistently wet => reduced friction

Leaking pipe => Earth movement might cause  
leak.

# 3D reconstruction from images

From 80 images:

# Indicator events in 3D

Retaining wall:  
bulges, tilting,  
bowing,  
undermining

Tree

Rail guard

# Current focus: development of cracks

Example: Spring Run Road

November 11, 2018

March 12, 2019

May 20, 2019

# 3D model of Spring Run Road landslide

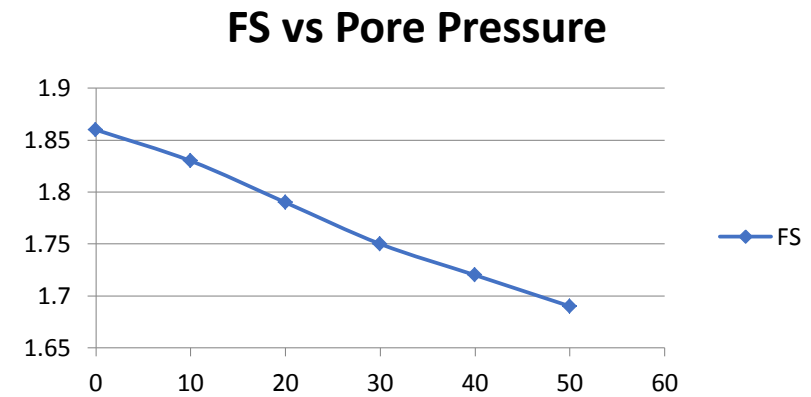

# Cross section

# Ordinary method of slices calculations

*Slicing of soil slope*

*FS variation with pore pressure*

Approximate (but useful) analysis: Force balance not satisfied exactly

# Cohesive zone model (CZM)

Cohesive zone model in fracture mechanics assumes the propagation of crack along specified path (i.e cohesive zone) defined by traction separation law. The material behavior at the interface is characterized by this assumption.

$$P = K_n u_n (1 - d_n)$$

*Traction separation law*

# CZM of a cantilever beam (Video)

# CZM of a cantilever beam

*Crack propagation in cantilever beam using CZM*

*Separation at edge node*

*Force reaction vs time*

# CZM of a soil slope (Video)

# CZM of a soil slope

*Ansyes model showing the sliding of assumed failure surface using CZM*

# Research Needs

- Improve CZ Finite Element model: Transform Mohr-Coulomb failure envelope to a CZM
- Discrete Element modeling – at realistic time scales – of landslide failure
- Develop software package combining ‘continuous’ image monitoring+analysis and mechanical failure modeling to **predict potential impending/future landslide failure**
